In various applications, such as wind turbines and free-piston engine gas compressors, it is necessary to regulate the position of a piston or similar element that is capable of moving in a controlled manner within a pressurized chamber. A pressure regulator valve is usually used in such applications to control the opening of a valve that restricts the passage of a working fluid through the pressurized chamber. As the position of the piston moves within the pressurized chamber, the pressure of the working fluid may vary within the pressurized chamber. The pressure regulator valve may have a limited ability to quickly change the restriction of the valve in order to minimize such pressure variations and achieve a relatively precise piston positioning. Such precise piston positioning may be necessary to achieve a desired product or process with the application device. Day 1: A boisterous reception welcomes us to the remote and lush Manchuria, a beautiful but risky corner of Northeast China. From the north you will see the massive cranes and heavy equipment of the Foxconn plant that is the single largest private employer in 82157476af
